

Federated Generative Modeling of Variability in Heterogeneous Multi-View Datasets

Irene BALELLI, Santiago SILVA, Marco LORENZI - Inria Sophia Antipolis - Méditerranée, Epione Research Project

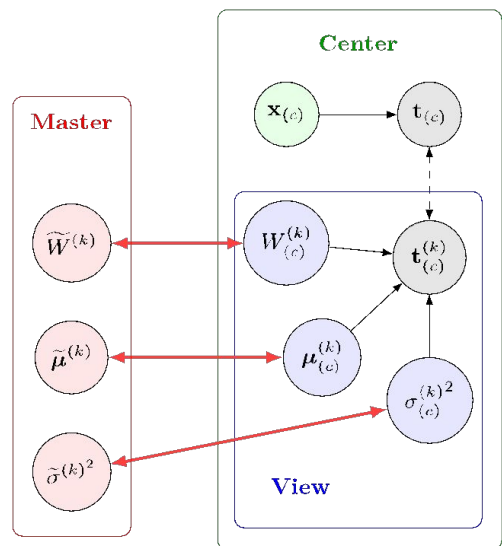

Multicentric biomedical studies faces 2 main challenges:

1. Heterogeneous distribution of datasets across centers
2. Complex multi-view high dimensional data

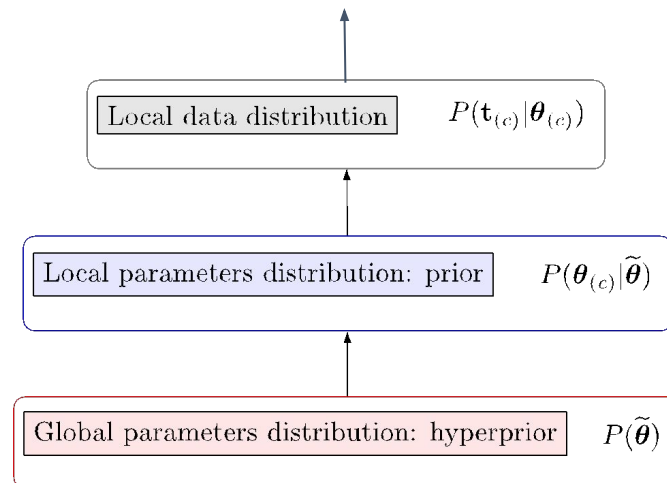

(a) Development of a novel Federated Learning paradigm

(b) For dimensionality reduction of **multi-view data**

Legend:
 ↔ Communication master-centers
 → Generative model
 ← - - Complete data to views-specific subset

$$t_{(c),n}^{(k)} = W_{(c)}^{(k)} x_{(c),n} + \mu_{(c)}^{(k)} + \epsilon_{(c)}^{(k)}$$

(c) Based on a hierarchical generative model

- High-quality data reconstruction even in highly non-iid settings
- Interpretability of data variability
